(54) Title: MULTIPLE FREQUENCY THROUGH-THE-WALL MOTION DETECTION AND RANGING USING DIFFERENCE-BASED ESTIMATION TECHNIQUE

(57) Abstract: A multi-frequency or multi-tone CW radar is used to project radar signals from the same antenna and to receive returns from the same antenna. The phase difference between the outgoing wave and the returns of the two-tone pulses is analyzed to determine both the existence of motion and the range to the moving object from the antenna. In a preferred embodiment a model is made which has range as its major parameter. The waveform associated with the phase difference between outgoing and returns for one of the tones is then compared against the templates produced by the model to determine which model has range that most closely matches. Using this technique and varying the range parameters, when one detects a match between the two waveforms one can obtain range to a moving object even if its motion is pseudo-random. If range is measured from multiple locations using two or more units, it is possible to measure the location of a moving object. In one embodiment, this is done by assuming a grid within a building. One then algorithmically combines the ranges from various locations. This is done by using the grid and a back-projection algorithm to provide the location of the moving object.
